

DataTrace

Social Distancing and Contact Tracing Sensors

DataTrace uses wearable sensors to both enforce social distancing and quickly run contact tracing reports if the need arises.

Our Contact Tracing Solution uses wearable tags that send audible, visual and vibration alerts when workers come within a certain distance of one another to support social distancing protocols. Fully integrated with our Time & Attendance platform, all instances of contact are automatically uploaded to our system to allow project teams to run a contact tracing report if required.

Contact Tracing

Quickly view a timestamped report of exactly who a tag has come into contact with and for how long.

Operative Registration

With full integration with DataScope's Time & Attendance System, quickly assign tags to operatives by scanning a tag's QR code using our app.

Reporting and Dashboards

Integrated with our Time & Attendance platform for contact tracing reporting and BI dashboards to show live tag information.

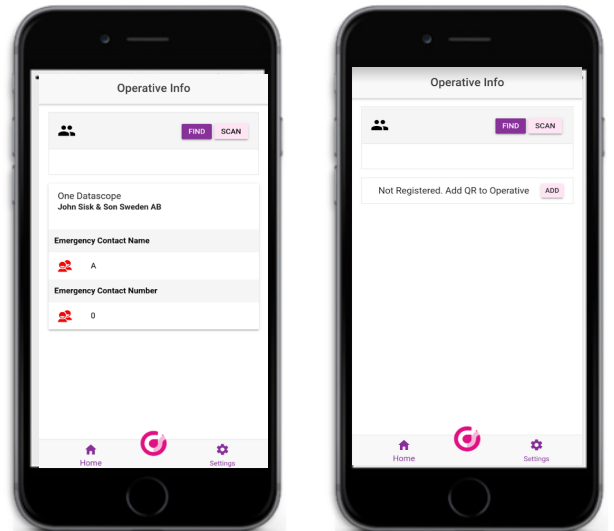

Key Features

- Tags use BLE beacon technology to identify proximity of other tags.
- Audible and vibration alerts are triggered when tags come within a pre-defined range.
- All equipment is pre-configured and only requires power.
- Integrated with our Time & Attendance platform for contact tracing reporting and dashboards.
- Timestamped reports of exactly who a tag has come into contact with and for how long.
- Hardware comes as a wearable sensor which can be attached to a lanyard and worn.
- Tags are rechargeable.
- Quickly assign tags to users by scanning the tag QR code using our app.

Operative Registration App

All contact tracing tags are supplied with a QR code to allow you to quickly assign tags to individual operatives or instantly view the operative information associated with a tag.

The app is linked directly with the Time & Attendance System allowing you to search and assign an operative to a tag from the database.

Contact Tracing

In the event that an operative reports Covid-19 symptoms, quickly run a detailed, timestamped report showing which operatives their tag has come into contact with.

The data stored in the Access Control system can then be leveraged to contact operatives impacted.

Dashboard Reports

DataTrace can also be linked directly with PowerBI dashboards to show live tag information such as number of people by company and area, operatives with tags not issued, total operatives by area and many more.
